

Abstract of the Disclosure

1
2 For fire fighting and emergency rescue in high-rise buildings the building can be
3 equipped with rails on the outside of the building. The rails have elevators, which travel
4 on the rails on the outside face of the building. Two elevators traveling in unison and
5 supporting a platform extending therebetween can provide a corridor and or a scaffold for
6 reaching anyplace on the face of a building. Other elevators or elevators with cranes can
7 be used on the rails in combination with the elevators with the platform to fight fires,
8 rescue people from the upper floors of buildings or perform maintenance or construction
9 tasks.
